

OFFICIAL WHITEPAPER • VERSION 1.0

Digital Iraqi Dinar (IQD) Stablecoin

A Decentralized, Transparent Digital Asset on Ethereum

Network:	Ethereum Mainnet (ERC20)
Contract Address:	0xd71ed2432adf3f7e35a20a4145fbcfba58ce3118
Official Website:	https://diqd26.github.io/IQDwebsite/
Community Portal:	Telegram (@diqd26)

1. Abstract & Executive Summary

The **Digital Iraqi Dinar (IQD)** is a decentralized, ERC20-compliant digital stablecoin engineered natively on the Ethereum blockchain. Designed to establish a reliable digital representation mirroring local transactional value, IQD combines the programmatic efficiency, global accessibility, and immutable security of decentralized finance (DeFi) with structural price stability.

By leveraging smart contract architecture on Ethereum, IQD allows users, traders, and regional participants to execute instant, borderless digital transfers and decentralized trades through automated liquidity protocols like Uniswap without relying on legacy bureaucratic infrastructure.

2. Vision and Problem Statement

Traditional financial transactions and cross-border currency transfers encounter significant friction, high processing fees, and geographic restrictions. While decentralized tokens offer speed and freedom, volatile cryptocurrencies expose holders to extreme market fluctuations, making them inefficient for routine transactions or steady value tracking.

Core Solution: IQD bridges this gap by introducing a decentralized, transparent stable-value asset on Ethereum, acting as an open financial tool that gives holders direct on-chain utility, high liquidity access via decentralized exchanges (DEXs), and complete self-custody over their funds.

3. Technical Specifications & Tokenomics

The IQD token is built according to standard ERC20 protocols, guaranteeing absolute interoperability with all major Web3 wallets and DeFi protocols.

Parameter	Specification Detail
Token Name	Digital Iraqi Dinar
Ticker Symbol	IQD
Blockchain	Ethereum Mainnet
Token Standard	ERC20

Contract Address	0xd71ed2432adf3f7e35a20a4145fbcfba58ce3118
Decimals	18

4. Core Features & Architecture

4.1 Ethereum Network Security

Built on Ethereum, IQD inherits robust cryptographic security, battle-tested standard interfaces (**ERC20**), and seamless compatibility with all major Web3 self-custody wallets (MetaMask, Trust Wallet, Ledger, etc.).

4.2 Decentralized Liquidity & Trading

IQD is paired directly into automated market makers (AMMs). Users can execute immediate, permissionless swaps on Uniswap and track real-time liquidity pools, trading volume, and historical charts transparently on analytics platforms like DexScreener.

4.3 Self-Custody & Censorship Resistance

As a purely decentralized asset, no third party controls or freezes user wallets. Holders maintain total ownership and cryptographic control of their private keys and assets at all times.

5. Ecosystem Use Cases

- **Digital Settlement:** Fast, low-latency peer-to-peer value transfer globally without intermediaries.
- **DeFi Integration:** Provision of liquidity into decentralized pools to earn yield or facilitate trading pairs.
- **Gateway Asset:** Serving as an accessible digital bridge for regional web3 adoption and tokenized applications.

6. Roadmap & Future Growth

Phase 1: Foundation & Deployment (Current)

- Smart contract deployment on Ethereum Mainnet (0xd71ed2432adf...).
- Liquidity pool deployment and Uniswap pairing.
- Launch of official community channels (**Telegram @diqd26**, X, TikTok, and GitHub) and project portal.

Phase 2: Aggregator Integration

- Submission and verification on community token lists (Uniswap default list).
- Global tracking integrations via **CoinGecko** and **CoinMarketCap**.

Phase 3: Ecosystem Expansion

- Expanding cross-platform liquidity pools.
- Integration with additional DeFi protocols and developer toolkits.
